Chapter 1

Known issues in the current version of NVML library

This is a list of known NVML issues in the current driver:

- On Linux GPU Reset can't be triggered when there is pending GPU Operation Mode (GOM) change
- On Linux GPU Reset may not successfully change pending ECC mode. A full reboot may be required to enable the mode change.
- [Accounting Statistics](#) supports only one process per GPU at a time (CUDA proxy server counts as one process).
- [nvmlAccountingStats_t::time](#) reports time and utilization values starting from cuInit till process termination. Next driver versions might change this behavior slightly and account process only from cuCtxCreate till cuCtxDestroy.
- On GPUs from Fermi family current P0 clocks (reported by [nvmlDeviceGetClockInfo](#)) can differ from max clocks by few MHz.

Chapter 2

Change log of NVML library

This chapter list changes in API and bug fixes that were introduced to the library

2.1 Changes between NVML v346 Update and v349

The following new functionality is exposed on NVIDIA display drivers version 349 Production or later

- Updated [nvmlDeviceGetAccountingPids](#), [nvmlDeviceGetAccountingBufferSize](#) and [nvmlDeviceGetAccountingStats](#) to report accounting information for both active and terminated processes. The execution time field in [nvmlAccountingStats_t](#) structure is populated only when the process is terminated.

2.2 Changes between NVML v340 Update and v346

The following new functionality is exposed on NVIDIA display drivers version 346 Production or later

- added the public APIs [nvmlDeviceGetPcieReplayCounter](#) and [nvmlDeviceGetPcieThroughput](#)
- Discontinued Perl bindings support
- Added [nvmlDeviceGetGraphicsRunningProcesses](#) to get information about Graphics processes running on a GPU.

2.3 Changes between NVML v331 Update and v340

The following new functionality is exposed on NVIDIA display drivers version 340 Production or later

- Added [nvmlDeviceGetSamples](#) to get recent power, utilization and clock samples for the GPU.
- Added [nvmlDeviceGetTemperatureThreshold](#) to retrieve temperature threshold information.
- Added [nvmlDeviceGetBrand](#) to retrieve brand information (e.g. Tesla, Quadro, etc.)
- Added support for K40d and K80
- Added [nvmlDeviceGetTopology](#) internal API to retrieve path info between PCI devices (remove this for DITA)
- Added [nvmlDeviceGetViolationStatus](#) to get the duration of time during which the device was throttled (lower than requested clocks) due to thermal or power constraints.
- Added [nvmlDeviceGetEncoderUtilization](#) and [nvmlDeviceGetDecoderUtilization](#) APIs
- Added [nvmlDeviceGetCpuAffinity](#) to determine the closest processor(s) affinity to a specific GPU
- Added [nvmlDeviceSetCpuAffinity](#) to bind a specific GPU to the closest processor
- Added [nvmlDeviceClearCpuAffinity](#) to unbind a specific GPU
- Added [nvmlDeviceGetBoardId](#) to get a unique boardId for the running system

- Added [nvmlDeviceGetAutoBoostedClocksEnabled](#) and [nvmlDeviceSetAutoBoostedClocksEnabled](#) for querying and setting the state of auto boosted clocks on supporting hardware.
- Added [nvmlDeviceSetDefaultAutoBoostedClocksEnabled](#) for setting the default state of auto boosted clocks on supporting hardware.

2.4 Changes between NVML v5.319 Update and v331

The following new functionality is exposed on NVIDIA display drivers version 331 Production or later

- Added [nvmlDeviceGetMinorNumber](#) to get the minor number for the device.
- Added [nvmlDeviceGetBAR1MemoryInfo](#) to get BAR1 total, available and used memory size.
- Added [nvmlDeviceGetBridgeChipInfo](#) to get the information related to bridge chip firmware.
- Added enforced power limit query API [nvmlDeviceGetEnforcedPowerLimit](#)
- Updated [nvmlEventSetWait](#) to return xid event data in case of xid error event.
- Added support for K8

2.5 Changes between NVML v5.319 RC and v5.319 Update

The following new functionality is exposed on NVIDIA display drivers version 319 Update or later

- Added [nvmlDeviceSetAPIRestriction](#) and [nvmlDeviceGetAPIRestriction](#), with initial ability to toggle root-only requirement for [nvmlDeviceSetApplicationsClocks](#) and [nvmlDeviceResetApplicationsClocks](#).

2.6 Changes between NVML v4.304 and v5.319 RC

The following new functionality is exposed on NVIDIA display drivers version 319 Production or later

- IMPORTANT: Added _v2 versions of [nvmlDeviceGetHandleByIndex](#) and [nvmlDeviceGetCount](#) that also count devices not accessible by current user
 - IMPORTANT: [nvmlDeviceGetHandleByIndex_v2](#) (default) can also return NVML_ERROR_NO_PERMISSION
- Added [nvmlInit_v2](#) and [nvmlDeviceGetHandleByIndex_v2](#) that is safer and thus recommended function for initializing the library
 - [nvmlInit_v2](#) lazily initializes only requested devices (queried with [nvmlDeviceGetHandle*](#))
 - [nvml.h](#) defines [nvmlInit_v2](#) and [nvmlDeviceGetHandleByIndex_v2](#) as default functions
- Added [nvmlDeviceGetIndex](#)

The following new functionality is exposed on NVIDIA display drivers version 295 or later

- deprecated `nvmlDeviceGetHandleBySerial` in favor of newly added `nvmlDeviceGetHandleByUUID`
- Marked the input parameters of `nvmlDeviceGetHandleBySerial`, `nvmlDeviceGetHandleByUUID` and `nvmlDeviceGetHandleByPciBusId` as `const`
- Added `nvmlDeviceOnSameBoard`
- Added `Constants` defines
- Added `nvmlDeviceGetMaxPcieLinkGeneration`, `nvmlDeviceGetMaxPcieLinkWidth`, `nvmlDeviceGetCurrPcieLinkGeneration`, `nvmlDeviceGetCurrPcieLinkWidth`
- Format change of `nvmlDeviceGetUUID` output to match the UUID standard. This function will return a different value.
- `nvmlDeviceGetDetailedEccErrors` will report zero for unsupported ECC error counters when a subset of ECC error counters are supported

2.10 Changes between NVML v1.0 and v2.285

The following new functionality is exposed on NVIDIA display drivers version 285 or later

- Added possibility to query separately current and pending driver model with `nvmlDeviceGetDriverModel`
- Added API `nvmlDeviceGetVbiosVersion` function to report VBIOS version.
- Added `pciSubSystemId` to `nvmlPciInfo_t` struct
- Added API `nvmlErrorString` function to convert error code to string
- Updated docs to indicate we support M2075 and C2075
- Added API `nvmlSystemGetHicVersion` function to report HIC firmware version
- Added NVML versioning support
 - Functions that changed API and/or size of structs have appended versioning suffix (e.g. `nvmlDeviceGetPciInfo_v2`). Appropriate C defines have been added that map old function names to the newer version of the function
- Added support for concurrent library usage by multiple libraries
- Added API `nvmlDeviceGetMaxClockInfo` function for reporting device's clock limits
- Added new error code `NVML_ERROR_DRIVER_NOT_LOADED` used by `nvmlInit`
- Extended `nvmlPciInfo_t` struct with new field: sub system id
- Added NVML support on Windows guest account
- Changed format of `pciBusId` string (to XXXX:XX:XX.X) of `nvmlPciInfo_t`
- Parsing of `busId` in `nvmlDeviceGetHandleByPciBusId` is less restrictive. You can pass 0:2:0.0 or 0000:02:00 and other variations

- Added API for events waiting for GPU events (Linux only) see docs of [Event Handling Methods](#)
- Added API [nvmlDeviceGetComputeRunningProcesses](#) and [nvmlSystemGetProcessName](#) functions for looking up currently running compute applications
- Deprecated [nvmlDeviceGetPowerState](#) in favor of [nvmlDeviceGetPerformanceState](#).

6.4.2 Define Documentation

6.4.2.1 `#define nvmlEventTypeClock 0x0000000000000010LL`

Kepler only

6.4.2.2 `#define nvmlEventTypeDoubleBitEccError 0x0000000000000002LL`

Note:

An uncorrected texture memory error is not an ECC error, so it does not generate a double bit event

6.4.2.3 #define nvmlEventTypePState 0x0000000000000004LL**Note:**

On Fermi architecture PState changes are also an indicator that GPU is throttling down due to no work being executed on the GPU, power capping or thermal capping. In a typical situation, Fermi-based GPU should stay in P0 for the duration of the execution of the compute process.

6.4.2.4 #define nvmlEventTypeSingleBitEccError 0x0000000000000001LL**Note:**

A corrected texture memory error is not an ECC error, so it does not generate a single bit event

6.5.2.5 `nvmlReturn_t DECLDIR nvmlDeviceGetAccountingStats (nvmlDevice_t device, unsigned int pid, nvmlAccountingStats_t * stats)`

Queries process's accounting stats.

For Kepler TM or newer fully supported devices.

Accounting stats capture GPU utilization and other statistics across the lifetime of a process. Accounting stats can be queried during life time of the process and after its termination. The time field in [nvmlAccountingStats_t](#) is reported as 0 during the lifetime of the process and updated to actual running time after its termination. Accounting stats are kept in a circular buffer, newly created processes overwrite information about old processes.

See [nvmlAccountingStats_t](#) for description of each returned metric. List of processes that can be queried can be retrieved from [nvmlDeviceGetAccountingPids](#).

Note:

Accounting Mode needs to be on. See [nvmlDeviceGetAccountingMode](#).

Only compute and graphics applications stats can be queried. Monitoring applications stats can't be queried since they don't contribute to GPU utilization.

In case of pid collision stats of only the latest process (that terminated last) will be reported

Warning:

On Kepler devices per process statistics are accurate only if there's one process running on a GPU.

Parameters:

device The identifier of the target device
pid Process Id of the target process to query stats for
stats Reference in which to return the process's accounting stats

Returns:

- [NVML_SUCCESS](#) if stats have been successfully retrieved

6.6 Initialization and Cleanup

Functions

- [nvmlReturn_t](#) DECLDIR [nvmlInit](#) (void)
- [nvmlReturn_t](#) DECLDIR [nvmlShutdown](#) (void)

6.6.1 Detailed Description

This chapter describes the methods that handle NVML initialization and cleanup. It is the user's responsibility to call [nvmlInit\(\)](#) before calling any other methods, and [nvmlShutdown\(\)](#) once NVML is no longer being used.

6.6.2 Function Documentation

6.6.2.1 [nvmlReturn_t](#) DECLDIR [nvmlInit](#) (void)

Initialize NVML, but don't initialize any GPUs yet.

Note:

In NVML 5.319 new [nvmlInit_v2](#) has replaced [nvmlInit_v1](#) (default in NVML 4.304 and older) that did initialize all GPU devices in the system.

This allows NVML to communicate with a GPU when other GPUs in the system are unstable or in a bad state. When using this API, GPUs are discovered and initialized in [nvmlDeviceGetHandleBy*](#) functions instead.

Note:

To contrast [nvmlInit_v2](#) with [nvmlInit_v1](#), NVML 4.304 [nvmlInit_v1](#) will fail when any detected GPU is in a bad or unstable state.

For all products.

This method, should be called once before invoking any other methods in the library. A reference count of the number of initializations is maintained. Shutdown only occurs when the reference count reaches zero.

Returns:

- [NVML_SUCCESS](#) if NVML has been properly initialized
- [NVML_ERROR_DRIVER_NOT_LOADED](#) if NVIDIA driver is not running
- [NVML_ERROR_NO_PERMISSION](#) if NVML does not have permission to talk to the driver
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

6.6.2.2 [nvmlReturn_t](#) DECLDIR [nvmlShutdown](#) (void)

Shut down NVML by releasing all GPU resources previously allocated with [nvmlInit\(\)](#).

For all products.

This method should be called after NVML work is done, once for each call to [nvmlInit\(\)](#). A reference count of the number of initializations is maintained. Shutdown only occurs when the reference count reaches zero. For backwards compatibility, no error is reported if [nvmlShutdown\(\)](#) is called more times than [nvmlInit\(\)](#).

Returns:

- [NVML_SUCCESS](#) if NVML has been properly shut down
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

6.11.1 Detailed Description

This chapter describes that queries that NVML can perform against each device. In each case the device is identified with an `nvmlDevice_t` handle. This handle is obtained by calling one of `nvmlDeviceGetHandleByIndex()`, `nvmlDeviceGetHandleBySerial()`, `nvmlDeviceGetHandleByPciBusId()`, or `nvmlDeviceGetHandleByUUID()`.

6.11.2 Function Documentation

6.11.2.1 `nvmlReturn_t DECLDIR nvmlDeviceClearCpuAffinity` (`nvmlDevice_t` device)

Clear all affinity bindings for the calling thread. Note, this is a change as of version 8.0 as older versions cleared the affinity for a calling process and all children.

For Kepler TM or newer fully supported devices. Supported on Linux only.

Parameters:

device The identifier of the target device

Returns:

- [NVML_SUCCESS](#) if the calling process has been successfully unbound

For all fully supported products.

Parameters:

device The identifier of the target device

Retrieve the current state of Auto Boosted clocks on a device and store it in *isEnabled*

For Kepler TM or newer fully supported devices.

Auto Boosted clocks are enabled by default on some hardware, allowing the GPU to run at higher clock rates to maximize performance as thermal limits allow.

6.11.2.6 nvmlReturn_t DECLDIR nvmlDeviceGetBoardId (nvmlDevice_t device, unsigned int * boardId)

Retrieves the device boardId from 0-N. Devices with the same boardId indicate GPUs connected to the same PLX. Use in conjunction with [nvmlDeviceGetMultiGpuBoard\(\)](#) to decide if they are on the same board as well. The boardId returned is a unique ID for the current configuration. Uniqueness and ordering across reboots and system configurations is not guaranteed (i.e. if a Tesla K40c returns 0x100 and the two GPUs on a Tesla K10 in the same system returns 0x200 it is not guaranteed they will always return those values but they will always be different from each other).

To query the current number of running compute processes, call this function with **infoCount* = 0. The return code will be [NVML_ERROR_INSUFFICIENT_SIZE](#), or [NVML_SUCCESS](#) if none are running. For this call *infos* is allowed to be NULL.

The *usedGpuMemory* field returned is all of the memory used by the application.

Keep in mind that information returned by this call is dynamic and the number of elements might change in time. Allocate more space for *infos* table in case new compute processes are spawned.

6.11.2.14 `nvmlReturn_t DECLDIR nvmlDeviceGetCount (unsigned int * deviceCount)`

Retrieves the number of compute devices in the system. A compute device is a single GPU.

For all products.

Note: New `nvmlDeviceGetCount_v2` (default in NVML 5.319) returns count of all devices in the system even if `nvmlDeviceGetHandleByIndex_v2` returns `NVML_ERROR_NO_PERMISSION` for such device. Update your code to handle this error, or use NVML 4.304 or older nvml header file. For backward binary compatibility reasons `_v1` version of the API is still present in the shared library. Old `_v1` version of `nvmlDeviceGetCount` doesn't count devices that NVML has no permission to talk to.

Parameters:

6.11.2.30 `nvmlReturn_t DECLDIR nvmlDeviceGetGraphicsRunningProcesses (nvmlDevice_t device, unsigned int * infoCount, nvmlProcessInfo_t * infos)`

Get information about processes with a graphics context on a device

For Kepler TMor newer fully supported devices.

This function returns information only about graphics based processes (eg. applications using OpenGL, DirectX)

To query the current number of running graphics processes, call this function with **infoCount* = 0. The return code will be [NVML_ERROR_INSUFFICIENT_SIZE](#), or [NVML_SUCCESS](#) if none are running. For this call *infos* is allowed to be NULL.

The *usedGpuMemory* field returned is all of the memory used by the application.

Keep in mind that information returned by this call is dynamic and the number of elements might change in time. Allocate more space for *infos* table in case new graphics processes are spawned.

[nvmlSystemGetProcessName](#)

6.11.2.31 `nvmlReturn_t DECLDIR nvmlDeviceGetHandleByIndex (unsigned int index, nvmlDevice_t * device)`

Acquire the handle for a particular device, based on its index.

For all products.

Valid indices are derived from the *accessibleDevices* count returned by [nvmlDeviceGetCount\(\)](#). For example, if *accessibleDevices* is 2 the valid indices are 0 and 1, corresponding to GPU 0 and GPU 1.

The order in which NVML enumerates devices has no guarantees of consistency between reboots. For that reason it is recommended that devices be looked up by their PCI ids or UUID. See [nvmlDeviceGetHandleByUUID\(\)](#) and [nvmlDeviceGetHandleByPciBusId\(\)](#).

Note: The NVML index may not correlate with other APIs, such as the CUDA device index.

Starting from NVML 5, this API causes NVML to initialize the target GPU NVML may initialize additional GPUs if:

- The target GPU is an SLI slave

Note: New `nvmlDeviceGetCount_v2` (default in NVML 5.319) returns count of all devices in the system even if `nvmlDeviceGetHandleByIndex_v2` returns `NVML_ERROR_NO_PERMISSION` for such device. Update your code to handle this error, or use NVML 4.304 or older `nvml` header file. For backward binary compatibility reasons `_v1` version of the API is still present in the shared library. Old `_v1` version of `nvmlDeviceGetCount` doesn't count devices that NVML has no permission to talk to.

This means that `nvmlDeviceGetHandleByIndex_v2` and `_v1` can return different devices for the same index. If you don't touch macros that map old (`_v1`) versions to `_v2` versions at the top of the file you don't need to worry about that.

Parameters:

index The index of the target GPU, ≥ 0 and $< accessibleDevices$

device Reference in which to return the device handle

Returns:

- [NVML_SUCCESS](#) if *device* has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *index* is invalid or *device* is NULL
- [NVML_ERROR_INSUFFICIENT_POWER](#) if any attached devices have improperly attached external power cables
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to talk to this device

- [NVML_ERROR_IRQ_ISSUE](#) if NVIDIA kernel detected an interrupt issue with the attached GPUs

6.11.2.32 `nvmlReturn_t DECLDIR nvmlDeviceGetHandleByPciBusId (const char * pciBusId, nvmlDevice_t * device)`

Acquire the handle for a particular device, based on its PCI bus id.

For all products.

This value corresponds to the `nvmlPciInfo_t::busId` returned by `nvmlDeviceGetPciInfo()`.

Starting from NVML 5, this API causes NVML to initialize the target GPU NVML may initialize additional GPUs if:

- The target GPU is an SLI slave

Note:

NVML 4.304 and older version of `nvmlDeviceGetHandleByPciBusId_v1` returns `NVML_ERROR_NOT_FOUND` instead of `NVML_ERROR_NO_PERMISSION`.

Parameters:

pciBusId The PCI bus id of the target GPU

device Reference in which to return the device handle

Returns:

- [NVML_SUCCESS](#) if *device* has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

- [NVML_ERROR_NOT_FOUND](#) if *pciBusId* does not match a valid device on the system
- [NVML_ERROR_INSUFFICIENT_POWER](#) if the attached device has improperly attached external power cables
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to talk to this device
- [NVML_ERROR_IRQ_ISSUE](#) if NVIDIA kernel detected an interrupt issue with the attached GPUs
- [NVML_ERROR_GPU_IS_LOST](#) if the target GPU has fallen off the bus or is otherwise inaccessible
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

Acquire the handle for a particular device, based on its board serial number.

For Fermi™ or newer fully supported devices.

This number corresponds to the value printed directly on the board, and to the value returned by `nvmlDeviceGetSerial()`.

Deprecated

Since more than one GPU can exist on a single board this function is deprecated in favor of [nvmlDeviceGetHandleByUUID](#). For dual GPU boards this function will return NVML_ERROR_INVALID_ARGUMENT.

6.11.2.62 `nvmlReturn_t DECLDIR nvmlDeviceGetSamples (nvmlDevice_t device, nvmlSamplingType_t type, unsigned long long lastSeenTimeStamp, nvmlValueType_t * sampleValType, unsigned int * sampleCount, nvmlSample_t * samples)`

Gets recent samples for the GPU.

For Kepler TM or newer fully supported devices.

Based on type, this method can be used to fetch the power, utilization or clock samples maintained in the buffer by the driver.

Power, Utilization and Clock samples are returned as type "unsigned int" for the union [nvmlValue_t](#).

To get the size of samples that user needs to allocate, the method is invoked with samples set to NULL. The returned samplesCount will provide the number of samples that can be queried. The user needs to allocate the buffer with size as samplesCount * sizeof(nvmlSample_t).

lastSeenTimeStamp represents CPU timestamp in microseconds. Set it to 0 to fetch all the samples maintained by the underlying buffer. Set lastSeenTimeStamp to one of the timeStamps retrieved from the date of the previous query to get more recent samples.

This method fetches the number of entries which can be accommodated in the provided samples array, and the reference samplesCount is updated to indicate how many samples were actually retrieved. The advantage of using this method for samples in contrast to polling via existing methods is to get higher frequency data at lower polling cost.

Parameters:

device The identifier for the target device

type Type of sampling event

lastSeenTimeStamp Return only samples with timestamp greater than lastSeenTimeStamp.

sampleValType Output parameter to represent the type of sample value as described in [nvmlSampleVal_t](#)

On Pascal and newer hardware, if clocks were previously locked with [nvmlDeviceSetApplicationsClocks](#), this call will unlock clocks. This returns clocks their default behavior of automatically boosting above base clocks as thermal limits allow.

See also:

[nvmlDeviceSetApplicationsClocks](#)

For Fermi TM or newer non-GeForce fully supported devices and Maxwell or newer GeForce devices.

Parameters:

6.13.2.3 `nvmlReturn_t DECLDIR nvmlDeviceSetApplicationsClocks (nvmlDevice_t device, unsigned int memClockMHz, unsigned int graphicsClockMHz)`

Set clocks that applications will lock to.

Sets the clocks that compute and graphics applications will be running at. e.g. CUDA driver requests these clocks during context creation which means this property defines clocks at which CUDA applications will be running unless some overspec event occurs (e.g. over power, over thermal or external HW brake).

Can be used as a setting to request constant performance.

On Pascal and newer hardware, this will automatically disable automatic boosting of clocks.

On K80 and newer Kepler and Maxwell GPUs, users desiring fixed performance should also call [nvmlDeviceSetAutoBoostedClocksEnabled](#) to prevent clocks from automatically boosting above the clock value being set.

For Kepler TM or newer non-GeForce fully supported devices and Maxwell or newer GeForce devices. Requires root/admin permissions.

See [nvmlDeviceGetSupportedMemoryClocks](#) and [nvmlDeviceGetSupportedGraphicsClocks](#) for details on how to list available clocks combinations.

- graphicsClockMHz* Requested graphics clock in MHz

Returns:

- [NVML_SUCCESS](#) if new settings were successfully set

- [NVML_ERROR_INVALID_ARGUMENT](#) if *device* is invalid or *memClockMHz* and *graphicsClockMHz* is not a valid clock combination
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation
- [NVML_ERROR_NOT_SUPPORTED](#) if the device doesn't support this feature

Set the driver model for the device.

For Fermi™ or newer fully supported devices. For windows only. Requires root/admin permissions.

On Windows platforms the device driver can run in either WDDM or WDM (TCC) mode. If a display is attached to the device it must run in WDDM mode.

It is possible to force the change to WDM (TCC) while the display is still attached with a force flag ([nvmlFlagForce](#)). This should only be done if the host is subsequently powered down and the display is detached from the device before the next reboot.

This operation takes effect after the next reboot.

Windows driver model may only be set to WDDM when running in DEFAULT compute mode.

Change driver model to WDDM is not supported when GPU doesn't support graphics acceleration or will not support it after reboot. See [nvmlDeviceSetGpuOperationMode](#).

See [nvmlDriverModel_t](#) for details on available driver models. See [nvmlFlagDefault](#) and [nvmlFlagForce](#)

Parameters:

Set the persistence mode for the device.

For all products. For Linux only. Requires root/admin permissions.

The persistence mode determines whether the GPU driver software is torn down after the last client exits.

Parameters:

device The identifier of the target device

eventTypes Reference in which to return bitmask of supported events

Returns:

- [NVML_SUCCESS](#) if the eventTypes has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

[Event Types](#)
[nvmlDeviceRegisterEvents](#)

6.15.3.2 `nvmlReturn_t DECLDIR nvmlDeviceRegisterEvents (nvmlDevice_t device, unsigned long long eventTypes, nvmlEventSet_t set)`

Starts recording of events on a specified devices and add the events to specified [nvmlEventSet_t](#)

For Fermi TM or newer fully supported devices. Ecc events are available only on ECC enabled devices (see [nvmlDeviceGetTotalEccErrors](#)) Power capping events are available only on Power Management enabled devices (see [nvmlDeviceGetPowerManagementMode](#))

For Linux only.

IMPORTANT: Operations on *set* are not thread safe

This call starts recording of events on specific device. All events that occurred before this call are not recorded. Checking if some event occurred can be done with [nvmlEventSetWait](#)

If function reports NVML_ERROR_UNKNOWN, event set is in undefined state and should be freed. If function reports NVML_ERROR_NOT_SUPPORTED, event set can still be used. None of the requested eventTypes are registered in that case.

Parameters:

device The identifier of the target device
eventTypes Bitmask of [Event Types](#) to record
set Set to which add new event types

Returns:

- [NVML_SUCCESS](#) if the event has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

See also:

[nvmlDeviceRegisterEvents](#)

6.15.3.5 nvmlReturn_t DECLDIR nvmlEventSetWait (nvmlEventSet_t *set*, nvmlEventData_t * *data*, unsigned int *timeoutms*)

Waits on events and delivers events

For Fermi TM or newer fully supported devices.

If some events are ready to be delivered at the time of the call, function returns immediately. If there are no events ready to be delivered, function sleeps till event arrives but not longer than specified timeout. This function in certain conditions can return before specified timeout passes (e.g. when interrupt arrives)

set Reference to set of events to wait on

data Reference in which to return event data

timeoutms Maximum amount of wait time in milliseconds for registered event

Returns:

- [NVML_SUCCESS](#) if the data has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *data* is NULL
- [NVML_ERROR_TIMEOUT](#) if no event arrived in specified timeout or interrupt arrived

- [nvmlReturn_t](#) DECLDIR [nvmlDeviceDiscoverGpus](#) ([nvmlPciInfo_t](#) *pciInfo)

6.16.1 Detailed Description

This chapter describes methods that NVML can perform against each device to control their drain state and recognition by NVML and NVIDIA kernel driver. These methods can be used with out-of-band tools to power on/off GPUs, enable robust reset scenarios, etc.

6.16.2 Function Documentation

6.16.2.1 [nvmlReturn_t](#) DECLDIR [nvmlDeviceDiscoverGpus](#) ([nvmlPciInfo_t](#) *pciInfo)

Request the OS and the NVIDIA kernel driver to rediscover a portion of the PCI subsystem looking for GPUs that were previously removed. The portion of the PCI tree can be narrowed by specifying a domain, bus, and device. If all are zeroes then the entire PCI tree will be searched. Please note that for long-running NVML processes the enumeration will change based on how many GPUs are discovered and where they are inserted in bus order.

In addition, all newly discovered GPUs will be initialized and their ECC scrubbed which may take several seconds per GPU. Also, all device handles are no longer guaranteed to be valid post discovery.

Must be run as administrator. For Linux only.

For newer than Maxwell TMfully supported devices. Some Kepler devices supported.

Parameters:

pciInfo The PCI tree to be searched. Only the domain, bus, and device fields are used in this call.

Returns:

- [NVML_SUCCESS](#) if counters were successfully reset
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *pciInfo* is invalid
- [NVML_ERROR_NOT_SUPPORTED](#) if the operating system does not support this feature
- [NVML_ERROR_OPERATING_SYSTEM](#) if the operating system is denying this feature
- [NVML_ERROR_NO_PERMISSION](#) if the calling process has insufficient permissions to perform operation
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

6.16.2.2 [nvmlReturn_t](#) DECLDIR [nvmlDeviceModifyDrainState](#) ([nvmlPciInfo_t](#) *pciInfo, [nvmlEnableState_t](#) newState)

Modify the drain state of a GPU. This method forces a GPU to no longer accept new incoming requests. Any new NVML process will no longer see this GPU. Persistence mode for this GPU must be turned off before this call is made. Must be called as administrator. For Linux only.

For newer than Maxwell™ fully supported devices. Some Kepler devices supported.

Parameters:

pciInfo The PCI address of the GPU drain state to be modified

newState The drain state that should be entered, see [nvmlEnableState_t](#)

Returns:

- [NVML_SUCCESS](#) if counters were successfully reset
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *nvmlIndex* or *newState* is invalid
- [NVML_ERROR_NOT_SUPPORTED](#) if the device doesn't support this feature
- [NVML_ERROR_NO_PERMISSION](#) if the calling process has insufficient permissions to perform operation
- [NVML_ERROR_IN_USE](#) if the device has persistence mode turned on
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

6.16.2.3 `nvmlReturn_t DECLDIR nvmlDeviceQueryDrainState (nvmlPciInfo_t * pciInfo, nvmlEnableState_t * currentState)`

Query the drain state of a GPU. This method is used to check if a GPU is in a currently draining state. For Linux only.
For newer than Maxwell™ fully supported devices. Some Kepler devices supported.

Parameters:

pciInfo The PCI address of the GPU drain state to be queried

currentState The current drain state for this GPU, see [nvmlEnableState_t](#)

Returns:

- [NVML_SUCCESS](#) if counters were successfully reset
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *nvmlIndex* or *currentState* is invalid
- [NVML_ERROR_NOT_SUPPORTED](#) if the device doesn't support this feature
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

6.16.2.4 `nvmlReturn_t DECLDIR nvmlDeviceRemoveGpu (nvmlPciInfo_t * pciInfo)`

This method will remove the specified GPU from the view of both NVML and the NVIDIA kernel driver as long as no other processes are attached. If other processes are attached, this call will return [NVML_ERROR_IN_USE](#) and the GPU will be returned to its original "draining" state. Note: the only situation where a process can still be attached after [nvmlDeviceModifyDrainState\(\)](#) is called to initiate the draining state is if that process was using, and is still using, a GPU before the call was made. Also note, persistence mode counts as an attachment to the GPU thus it must be disabled prior to this call.

For long-running NVML processes please note that this will change the enumeration of current GPUs. For example, if there are four GPUs present and GPU1 is removed, the new enumeration will be 0-2. Also, device handles after the removed GPU will not be valid and must be re-established. Must be run as administrator. For Linux only.

For newer than Maxwell™ fully supported devices. Some Kepler devices supported.

Parameters:

pciInfo The PCI address of the GPU to be removed

Returns:

- [NVML_SUCCESS](#) if counters were successfully reset
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *nvmlIndex* is invalid
- [NVML_ERROR_NOT_SUPPORTED](#) if the device doesn't support this feature
- [NVML_ERROR_IN_USE](#) if the device is still in use and cannot be removed

6.17.1.4 #define nvmlClocksThrottleReasonHwSlowdown 0x0000000000000008LL

HW Slowdown (reducing the core clocks by a factor of 2 or more) is engaged

This is an indicator of:

- temperature being too high
- External Power Brake Assertion is triggered (e.g. by the system power supply)
- Power draw is too high and Fast Trigger protection is reducing the clocks
- May be also reported during PState or clock change
 - This behavior may be removed in a later release.

6.17.1.5 #define nvmlClocksThrottleReasonNone 0x0000000000000000LL

Bit mask representing no clocks throttling

Clocks are as high as possible.

6.17.1.6 #define nvmlClocksThrottleReasonSwPowerCap 0x0000000000000004LL

SW Power Scaling algorithm is reducing the clocks below requested clocks

6.17.1.7 #define nvmlClocksThrottleReasonSyncBoost 0x0000000000000010LL

Sync Boost

This GPU has been added to a Sync boost group with nvidia-smi or DCGM in order to maximize performance per watt. All GPUs in the sync boost group will boost to the minimum possible clocks across the entire group. Look at the throttle reasons for other GPUs in the system to see why those GPUs are holding this one at lower clocks.

6.17.1.8 #define nvmlClocksThrottleReasonUnknown 0x8000000000000000LL

Some other unspecified factor is reducing the clocks

6.17.1.9 `#define nvmlClocksThrottleReasonUserDefinedClocks nvmlClocksThrottleReasonApplicationsClocksSetting`

Deprecated

Renamed to [nvmlClocksThrottleReasonApplicationsClocksSetting](#) as the name describes the situation more accurately.
